

NUTR 803
Introduction to Advanced Nutrition Intervention and
Policy Research Methods
Spring 2014

Instructors:

Deborah Tate (dtate@unc.edu)
Dianne Ward (dsward@email.unc.edu)
Temitope Erinoshon (erinosho@email.unc.edu)

Course Meetings:

Wednesday, 2:00 to 4:00 PM
304 Rosenau

Teaching Assistant:

Stephanie Mazzucca (mazzucca@unc.edu)

Office Hours:

By appointment

Course website:

www.unc.edu/sakai

Course description:

This course will continue to cover the selected topics in nutrition intervention and policy research design and evaluation covered in the fall session of NUTR 801. Additional topics focused on in this course include implementing intervention research and policy studies. Students will gain familiarity with historical and innovative nutrition trials' design and implementation.

Course Objectives

1. Describe different randomization techniques and justification for use, including basic randomization and blinding implementation strategies.
2. Describe the difference between bias and random error and strategies for minimization.
3. Explain factors that are used to select intervention control/comparison groups and how selection of these groups affects the interpretation of a clinical trial.
4. Describe how to determine sample sizes for clinical trials.
5. Describe effective approaches for recruitment and retention of study participants.
6. Describe the data collection requirements of a trial.
 - a. Recommend different questionnaire types and data collection form techniques to ensure quality data.
 - b. Explain how to develop new measures or questionnaires, including assessment of their psychometric properties.
7. List the advantages of intent-to-treat analysis and differentiate its interpretation from that of a other analyses, such as a "completers" analysis.
8. Describe quality assurance procedures for clinical trials.
9. Describe how policy interventions are designed to address nutrition issues
10. Explain the process of policy evaluation, as well as alternative policy and environment strategies that impact public health outcomes.
11. Explain how to support policy recommendations with qualitative and quantitative analyses.
12. Describe dissemination and implementation (D&I) research and understand how D&I studies can be used to promote use of evidence-based programs in real-world settings.

Prerequisites: Advanced Nutrition Intervention and Research Methods I and II.

Assignments.

Assignments include:

1. Group project (40%)
2. Lecture preparation (40%)

3. Journal club (10%)
4. General class participation (10%)

Students will be assigned to assist with two lecture sessions during the semester. For each of these lectures, students will be responsible for meeting with the presenter for the lecture and working with the presenter to develop lecture slides and materials for use during class. Students should pull from their experiences with last year's course to improve these lectures and help the presenter modify their presentations.

Also, students will be assigned to lead one journal club discussions during the semester. As part of this assignment, the discussion leader will be expected to read the paper assigned for the discussion as well as published papers on the intervention's design, rationale, and intervention descriptions, if available. These papers, as well as other relevant papers, will be added to a bibliography of paper related to the intervention. This bibliography will be shared with all students in the course. For each week that there is a journal club article assigned, students will submit at least one discussion question by Tuesday night. Additionally, students leading the journal club will incorporate the other students' questions to guide their discussion.

Last, throughout the semester, students will continue to work as a group to develop a mini-course on public health nutrition research intended for use by undergraduate students. Specific details on this assignment are provided below.

Semester Project

The objective of this project is to create a stand-alone "mini course" introduction to public health nutrition research. The intended audience is undergraduate students who are entering into the BSPH Nutrition major and beginning their required research experience with a faculty member; however, the course may also be used by others (for example, incoming doctoral students in IP who want to review or brush up prior to enrolling in the methods course sequence). The end product, to be completed in the spring of 2014, will be a series of presentations similar to a webinar, with powerpoint presentations accompanied by an audio recording.

For this semester, the expectation is that you will create the final project so that it is ready for "pre-testing" fall 2014 with a small group of undergraduates. The content will be developed based on your Fall 2013 detailed outline, any may draw on some of the slides from our class (modified for younger learners). The teaching team will work with you throughout the semester to guide the development of the presentations.

Grading

Students will be evaluated on their ability to:

- Evaluate research papers based on the components of excellence in nutrition intervention and policy research (journal club discussions)
- Facilitate development of a lecture session
- Lead journal article discussion (ratings by course instructors)
- Develop an introduction to public health nutrition research mini-course
- Participate in class discussions, by asking questions, providing comments, and/or answering questions

Grading for the class will be determined as follows:

H Student reads and critically engages with all of the assigned material. Participation in discussion and written assignments exhibit the ability not only to apply the material, but also to extrapolate ideas, expand into new areas, and contribute to the body of scholarship in the area. Reserved for truly extraordinary work (i.e., $\geq 90\%$).

P Student usually reads and engages critically with the assigned material. Able to apply material and extrapolate ideas. Consistently good work done on time (i.e., 76%-89%).

L Student reads and engages critically with only some of the assigned material. Able to apply the material and extrapolate ideas in only some instances (i.e., 65%-75%).

F Student occasionally misses class, does not always read the material, fails to critically engage with it, and is unable or unwilling to apply the material (i.e., below <65).

Honor Code

Students must observe the Honor Code in all course assignments. You are expected to produce your own work, except where group work is specifically allowed. In all written assignments, you must not plagiarize the work of others. The instrument defining the Honor Code defines plagiarism as "deliberate or reckless representation of another's words, thoughts, or ideas as one's own without attribution in connection with submission of academic work, whether graded or otherwise." If you have questions about your responsibility under the honor code, please bring them to one of the instructors or consult with the office of the Dean of Students or the Instrument of Student Judicial Governance. This document, adopted by the Chancellor, the Faculty Council, and the Student Congress, contains all policies and procedures pertaining to the student honor system.

Please include the following pledge on all written assignments: "On my honor, I have neither given nor received unauthorized aid on this assignment."

Course Readings

Required Text:

Hulley, S. B., Cummings, S. R., Browner, W. S., Grady, D. G., & Newman, T. B. (2007). *Designing Clinical Research* (3rd edition). Philadelphia: Lippincott Williams & Wilkins. Available for purchase online and in the UNC Student Store.

Suggested Text:

Shadish, W.R., Cook, T.D., and Campbell, D.T. (2002). *Experimental and Quasi-Experimental Designs for Causal Inference*. Boston: Houghton Mifflin Co.

Other readings are available electronically on the Sakai website
